
Mean heating and gas storage are different observables
Run: completed | Validation: False | Periodic: True | Mean thermal: False
a
Cycle range
Cycle mean
10-cycle mean
$T_s - T_0$ (K)
Time (ms)
b
Total storage: cycle range and 10-cycle mean
One-side ΔE_g (J m^{-2})
Time (ms)
c
Sensible excess: warming diagnostic
$\int \rho c_v (T - T_0)\, dz$ (J m^{-2})
Time (ms)
d
Mass leaves the open control volume
Gas mass change (%)
Time (ms)

Acoustic response from startup through the full observation

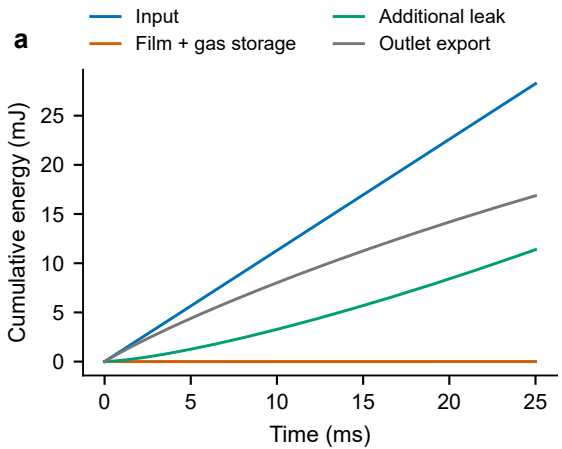

Run: completed | Validation: False | Periodic: True | Mean thermal: False

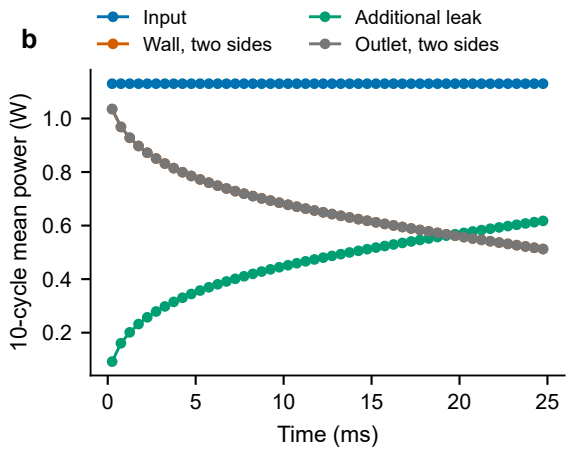

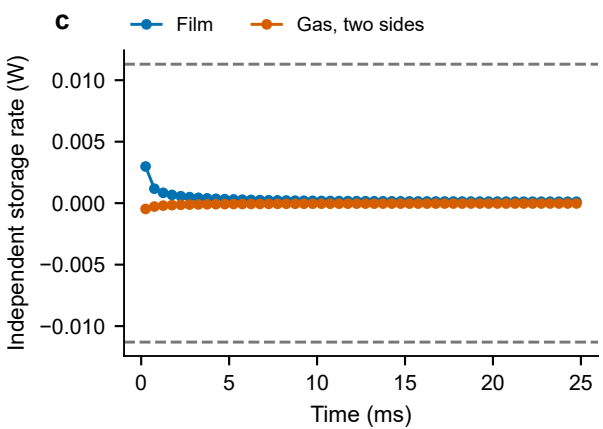

Ten-cycle means test continued thermal and flow evolution
Run: completed | Validation: False | Periodic: True | Mean thermal: False
10-cycle window midpoint (ms)
5
10
15
20
a
⟨T⟩ − T0 (K)
Distance (mm)
b
⟨uy⟩ (m s−1)
Distance (mm)
c
Film
Temperature profile
Mean-temperature change / limit
Window end time (ms)
d
Mean velocity profile
Acceptance limit
Mean-velocity change / limit
Window end time (ms)

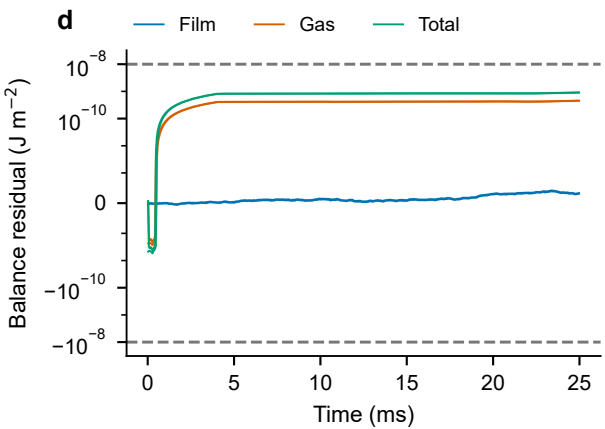

Energy balance passes; cumulative mass balance fails

Run: completed | Validation: False | Periodic: True | Mean thermal: False

Outlet background: changes relative to the cold reference

Run: completed | Validation: False | Periodic: True | Mean thermal: False
